Customer Service Standard Operating Procedure

MetroGrid Utilities — Demonstration Knowledge Base | Owner: Customer Experience | Version: 4.1 | Status: Approved for Demo

Purpose

The customer service function provides the first point of contact for many utility requests. Representatives are expected to verify the appropriate customer and service information, identify the nature of the request, use current approved procedures and record the outcome in the designated service system. The objective is consistent handling while ensuring that cases requiring specialist review are routed appropriately.

Request identification

During an interaction, the representative should establish what the customer is trying to accomplish and classify the request using the available service categories. Common categories include billing and payment, meter services, outage-related questions, service connections, complaints and other operational requests. The category should reflect the customer's actual issue rather than the first keyword used in the conversation.

Using organizational knowledge

Representatives should use the current approved knowledge sources when a procedure is not immediately known. The Utility Knowledge Assistant can be used as a conversational way to locate relevant documented information. Employees should review the cited source and apply their role permissions and established controls when acting on the information returned by the assistant.

Case recording

A service record should contain the information necessary for the next team to understand what happened and what action is expected. Depending on the request, this can include account or service identifiers, the customer's description, dates, readings, supporting evidence, actions already taken and the reason for escalation.

Escalation

A representative should escalate a case when it involves an immediate safety concern, a decision outside the representative's authority, a complex technical or billing issue, a customer request for supervisor review, or an exception for which the approved procedure does not provide sufficient guidance. An employee should not invent a process to fill a knowledge gap.

Assistant limitations

The Utility Knowledge Assistant is a knowledge-access tool. It can help locate and summarize approved procedures, but it does not grant additional authority, approve exceptions or replace required human review. Where the knowledge base does not contain sufficient information, the representative should follow the normal escalation or knowledge-management process.
