Outage Management and Electrical Safety SOP

MetroGrid Utilities — Demonstration Knowledge Base | Owner: Network Operations | Version: 6.3 | Status: Approved for Demo

Purpose

This procedure supports consistent handling of customer reports involving power interruptions and potential electrical hazards. The service representative gathers initial information and communicates verified status while emergency and technical decisions remain with the appropriate operations teams.

Routine outage report

For a reported interruption, the representative should verify the service address or account and determine whether the customer reports an interruption limited to the premises or one affecting nearby premises as well. The representative should check the approved outage-status system and record the report time when available. The current published status should guide customer communication.

Restoration information

An estimated restoration time should not be invented or inferred by the representative. If an approved restoration estimate is published by the operations team, the representative may communicate it using the wording and qualification required by the customer-service procedure. When no estimate is published, the representative should communicate the latest available status rather than provide an unsupported time.

Immediate electrical hazards

Reports of downed power lines, exposed conductors, fire, sparks, damaged electrical equipment or another immediate electrical hazard require the safety or emergency escalation process. The representative should not instruct the customer to approach, touch, move or inspect damaged electrical equipment. Safety handling takes precedence over routine outage communication.

Follow-up

After the immediate safety or outage workflow has been initiated, the service record should capture the relevant location, reported condition, time information and action taken. Further technical investigation is performed by the responsible operations team.
