Service Connection and Reconnection Guide

MetroGrid Utilities — Demonstration Knowledge Base | Owner: Service Delivery | Version: 3.7 | Status: Approved for Demo

Overview

Requests for new service, reconnection or changes to an existing service require information appropriate to the request type and may involve technical assessment. Customer service representatives should collect the information defined by the current checklist and route technical work to the responsible team.

New service request

A new connection request generally begins with identification of the applicant and service address, followed by collection of the property or premise information and supporting documents required for the connection type. The representative should create the appropriate service case and ensure that missing information is identified before the request proceeds to the next stage.

Technical assessment

Some connection requests require a technical assessment before the next customer-facing step can be confirmed. The service representative should not promise a technical outcome, installation date or connection configuration that has not been approved by the responsible team.

Reconnection

A reconnection request should be handled according to the applicable account and service status. The representative should confirm the reason for the request, check the information available in the authorized system and apply the current reconnection workflow. Cases involving restrictions, exceptions or missing approvals should be escalated rather than handled through an improvised process.

Document checklist control

The exact supporting-document checklist can vary by connection type and applicable company rules. Employees should use the current approved checklist rather than relying on memory or an old document. Knowledge administrators are responsible for maintaining the current version of the checklist in the knowledge base.
