Complaint, Escalation and Knowledge Gap Guidelines

MetroGrid Utilities — Demonstration Knowledge Base | Owner: Customer Experience Governance | Version: 2.8 | Status: Approved for Demo

Purpose

Escalation ensures that cases are handled by a person or team with the appropriate authority and expertise. Escalation is not a failure of the service process; it is part of the control framework for situations involving safety, exceptions, specialist investigation or decisions beyond the employee's role.

Safety escalation

Immediate electrical hazards, including downed lines, exposed conductors, fire, sparks or dangerous damaged equipment, should be handled through the emergency or safety process. The employee should follow the approved emergency instructions and should not attempt to resolve a hazardous technical condition through normal customer-service steps.

Supervisor review

A supervisor review may be appropriate when a customer disputes an agent-level decision, requests an exception review, or when the representative is uncertain whether the case falls within their authority. The case should include the relevant facts and actions already taken so that the supervisor can make an informed decision.

Specialist investigation

Complex billing, technical or operational cases may require specialist investigation. The employee should capture the relevant information, identify the reason for escalation and route the case using the designated queue or workflow.

Knowledge gaps

If an employee cannot find an approved procedure for a business question, the employee should not create an answer based on assumptions or use an obsolete document. The question should be escalated to the designated knowledge owner or supervisor, and the missing knowledge can be recorded as a knowledge-management gap for review.

Use of the AI assistant

The Utility Knowledge Assistant can help identify relevant documented information and explain it in natural language. It should not be treated as an authority to approve exceptions, bypass safety controls or replace mandatory human review. When the retrieved information is insufficient, the assistant should clearly communicate the limitation and direct the user toward the appropriate escalation path.
