Knowledge Governance and AI Usage Policy

MetroGrid Utilities — Demonstration Knowledge Base | Owner: Enterprise Knowledge Management | Version: 1.9 | Status: Approved for Demo

Purpose

The Utility Knowledge Assistant relies on organizational knowledge that must remain current, traceable and appropriately controlled. This guide establishes principles for maintaining the documents used by the assistant and for using AI-generated responses responsibly.

Source ownership

Each knowledge document should have an accountable owner responsible for its business accuracy. The owner should review changes to the underlying process and ensure that superseded guidance is removed from active use. Metadata should identify the document title, version, owner and review status where the knowledge platform supports those fields.

Retrieval and response behavior

The assistant is intended to retrieve relevant passages from approved knowledge sources and use them as context for an LLM-generated response. A response should reflect the retrieved content and should not introduce a new company policy merely because the language model can generate plausible text. Source references should be displayed where the implementation supports them.

When information is unavailable

If the knowledge base does not contain sufficient information to answer a question, the assistant should state that limitation instead of presenting an unsupported procedure as fact. The user can then follow the normal escalation or knowledge-request process. This behavior is especially important for safety, regulatory, financial, customer-account and other high-impact topics.

Access and confidentiality

Access to knowledge should follow the organization's authentication, authorization, data classification and confidentiality requirements. Restricted documents should not be exposed to users who are not authorized to access them. The AI layer should not be used to bypass existing permissions.

Evaluation

Before production deployment, the organization should evaluate retrieval relevance, answer correctness, source traceability, unsupported-answer rate, user feedback and behavior on questions outside the knowledge base. Evaluation should use representative business questions and approved reference answers or source passages.

Human accountability

The assistant supports employees; it does not transfer business accountability to the model. Required approvals, technical decisions, emergency procedures and role-based controls remain governed by the organization's established processes.

Demonstration document. This fictional content is intended for RAG evaluation and customer demonstration only. Replace with client-approved content before production use.
